YALE REPORTS INITIAL SUCCESS AT CAROL, SONORA, MEXICO

Yale Resources Ltd. (TSX-V - YLL and Frankfurt - YAB) is pleased to announce that phase one of the exploration program at its wholly owned Carol property, located in southern Sonora State, Mexico has been successfully completed. Phase one consisted of a wide spaced sampling program with the goal of narrowing the exploration area for future work programs.

The program defined a large skarn body that, to date, measures 1,100 metres long and 400 metres wide located in the southern portion of the property – previously referred to as the Balde Skarn zone.

As the target area was so large samples were taken at 50 metre intervals along sample lines spaced at 100 metres in order to get initial coverage of the whole area. As can be expected from such a large area, sampling has returned a wide range of results – from negligible to significant. The Company is very encouraged by the wide distribution of anomalous results and in particular the high values that have been returned. The highest assays for significant elements are as follows:

Gold – 6.31 g/t Silver – 69.5 g/t Zinc – 8.13 % Copper – 4.86 %

Trenching now must be done between and around the high grade samples from this first program. A priority area for follow up sampling will be a 200 by 300 metre zone located in the southwestern portion of the grid where three contiguous samples returned 0.506 g/t, 1.875 g/t, and 6.310 g/t of gold (a 100 metre wide potential area as a primary gold target) and where four consecutive samples (a width of at least 200 metres) returned high copper and zinc values - up to a maximum of 1.78 % copper and 1.39 % zinc.

With the widely spaced irregular distribution of samples grading +1% copper and/or zinc throughout the rest of the Balde Skarn zone, a follow-up detailed sampling program is required to further constrain the distribution of the mineralization. Since the sample spacing was so wide, there is still a lot of room to define significant mineralization.

About the Carol property:

The Carol property is approximately 6 km north of Frontera Copper Corp.'s Piedras Verdes Mine that has a reported proven and probable reserve of 191 million tonnes grading 0.36% copper (Frontera Copper's website). Due to the proximity of the Piedras Verdes mine, the Carol property has excellent infrastructure and there is road access to the core of the property.

On behalf of the Board,

“Ian Foreman”

Ian Foreman, P.Geo.

President
