YALE RELEASES SECOND SET OF ASSAYS FROM LA VERDE GRANDE MINE

Yale Resources Ltd. (TSX-V - YLL and Frankfurt - YAB) is pleased to release the assay results from the lower level of the northeast extension of the La Verde Grande Mine, with a weighted average of **2.57 % copper, 86.8 g/t silver, 0.97 % zinc, 0.19 g/t gold over a average vertical height of 1.89m**. The La Verde Grande Mine is one of eight known deposits/targets within the wholly owned 26.4 square km La Verde Project, located 45 km northwest of Hermosillo, Sonora State, Mexico.

For a map showing all of the results received to date from the Northeast extension please see <http://www.yaleresources.com/i/maps/northeast-extension.jpg>. The lower level of the northeast extension is roughly L-shaped with two tunnels 20 metres and 35 metres long. All of the workings are within mineralization and as such, the limits of mineralization have yet to be defined. The deposit remains open in all directions.

Yale's short term goal is to show the potential for a multi-million tonne resource at the La Verde Grande mine. The management of Yale believes that the resources from all deposits within the La Verde property - yet to be tested - have the potential to be added together to create a significant combined resource.

Below is a table of all samples received from the lower level of the northeast extension. The weighted average of the lower level is **2.57 % copper, 86.8 g/t silver, 0.97 % zinc, 0.19 g/t gold**.

Sample Length	Cu (%)	Ag (g/t)	Zn (%)	Au (g/t)
1.90	3.10	214.0	0.78	0.16
1.90	1.49	5.0	0.82	0.06
1.90	2.44	115.0	1.07	0.25
1.90	1.88	50.4	0.36	0.08
1.90	1.66	31.6	1.60	0.06
1.85	4.75	179.0	0.66	0.22
2.00	3.36	173.0	2.38	0.28
1.80	3.46	64.9	1.55	0.25
2.00	2.68	23.8	0.36	0.47
1.75	0.79	4.4	0.07	0.02

Samples were taken as vertical chip channel samples at 5 metre intervals along the left hand wall of the workings. The average height of the tunnel is 1.89 m.

About the La Verde Project:

The La Verde project covers 2,640 hectares (26.4 square kilometres) and is located 45 kilometres northwest of Hermosillo, Sonora state, Mexico. In addition to the historic La Verde Grande copper-silver-zinc-gold mine, the La Verde project contains at least five other known deposits that have all seen limited production. The La Verde Grande Mine is a skarn deposit with a historic resource of 459,551 tonnes grading 2.29 per cent copper, 98.54 g/t silver and 0.38 g/t gold. In addition to possible extensions to the La Verde Grande Mine, the La Verde project has considerable exploration potential.

In addition, the La Sierrita copper-zinc-molybdenum porphyry, located in the northeast of the project area, covers an area of approximately four square kilometres and has seen only limited exploration.

Ian Foreman, P.Geol., is the Qualified Person, according to National Instrument 43-101, for the La Verde Project and is responsible for the technical data mentioned in this news release. All 'Historic Data' is presented for reference only and should not be relied upon as it pre-dates NI 43-101.

All of the samples mentioned in this release were prepared and analyzed by ALS Chemex at their labs in Hermosillo and Vancouver and generally consisted of 2-4 kg of material. Gold analyses were performed by 30 gram fire assay with an AA finish. Silver, copper and zinc were analyzed as part of a multi-element ICP package using an aqua regia digestion; samples with more than 100 g/t silver, 1% copper and/or 1% zinc (over limit) were re-analyzed using ALS Chemex's 'ore grade' detection limits.

On behalf of the Board,

"Ian Foreman"

Ian Foreman, P.Geol.
President
