Emil Malak Wrote!

I am NOT a scientist or an economist, but I do conduct a lot of research. I speak with many experts in various fields and I love acquiring knowledge. The opinions expressed in this article are my own. They are straight to the point, hard hitting and presented in a take no prisoners' manner. I am NOT an anti-vaxxer, nor do I subscribe to any crazy conspiracy theories. On the contrary, I am a proponent of vaccines so long as they are safe. Vaccines have played an important part in the safety of the public and have eradicated the threat of diseases like polio and the measles, and we need to continue research to develop new vaccines in the future.

No political angle; only opinions based on science, facts and historical events

Over the past twelve months I have written seventeen op-eds on the coronavirus for the average person like me. To date, many of my predictions have been coming true. By now we all recognize that vaccines are doomed to fail. The problem is governments have committed themselves so strongly to having a vaccine solution that they will be hard pressed to admit to failure. Is it more important for them to save face than to save lives??? Recently I have received many requests to republish my articles. I am currently in the process of putting them together and will post them online again soon.

We Must Prepare for Four More Years of Coronavirus

A therapeutic drug cocktail is the only medical solution, Testing everyone every three days is the only economic solution

By placing so much focus on vaccines, western governments, although well intended have nonetheless failed us all. Operation Warp Speed was doomed from the start because the virus was mutating faster than the vaccines could be developed. Vaccines will not be the solution. We are NOT going to vaccinate our way out of the virus.

With the United States taking the lead, western countries have all but ignored supporting therapeutics. Instead, they invested in huge grants for vaccine development. That will prove to be a grave mistake. Also, failure to focus on the development of an accurate rapid test is already strangling western economies.

If an inexpensive self-administered rapid test were available, there would be no need to shut down the economy as many countries are currently doing. Everyone could be tested every three days and receive their test result to their mobile device. Those who can display a negative result would go about their normal lives. Those who test positive would isolate for the necessary period and receive proper medical attention. Instead, we have flushed billions of dollars down the toilet chasing a nonexistent vaccine solution that has already become obsolete in the very early stages of its roll out because of the mutations. We cannot continuously add boosters every time a new variant pops up. Effective therapeutics and rapid testing as I have described above in many previous articles are the solutions, we need to beat the coronavirus.

A recent Bloomberg report estimates the COVID-19 Worldwide Pandemic Could Last Seven More Years; and that is assuming the vaccines are successful

Are we going to ban travel for the next seven years?

A recent Bloomberg report which assumes the vaccines are successful and working as intended, estimates the worldwide pandemic could last another seven years because of the disjointed rollout of the current vaccine program. We all know that governments will not admit that COVID-19 is long gone. Because of mutation, today we are dealing with COVID-21; tomorrow it will be COVID-22. Herd immunity will not be achieved and attempts to achieve herd immunity in Sweden and Brazil have already failed.

<https://www.news.com.au/world/europe/swedens-herd-immunity-strategy-has-failed-hospitals-inundated/news-story/374e397d9232036000a1d38548eabff9>

Coronavirus vaccines are leading us like lambs to the slaughterhouse

Five years of gathering data are needed to properly evaluate the efficacy of a vaccine and know what the side effects will be. The development of the current vaccines has been drastically rushed, and in the process, we have been used as guinea pigs by pharmaceutical companies. There has been and continues to be a vigorous misinformation campaign regarding vaccines by the mainstream media, Hollywood, the Silicon Valley, and social media companies. Globalization has become the new norm and those who dare to oppose them are silenced. Truth is treated as fiction. Often facts are manipulated as has been the case regarding neutralizing antibodies. They have told us the vaccines are effective because neutralizing antibodies have been detected six months post infection, but they don't tell us what happens to those antibodies after eight months or one year.

MERS and SARS belong to the same coronavirus family, and no vaccines have been found to be effective for neither. What is different about this coronavirus that makes them think a vaccine that was developed in record time will work? We are heading straight for a human coronavirus endemic disaster of our own making.

The same drug cocktail treatment model used for HIV should be applied to the coronavirus

To date there have been more than 30 failed HIV vaccine attempts

Developing an effective therapeutic drug cocktail is the way to manage and defeat the virus as it was with HIV/AIDS. In the early days of the AIDS epidemic, getting diagnosed with HIV was a certain death sentence. Within a few years a therapeutic drug cocktail was developed that made living with HIV manageable. Since the early 1990's drug protocols have been in place that can help a person with HIV live to a normal or near normal life expectancy. Since 1987, more than 30 HIV candidate vaccines have been tested in 60 Phase I/II trials, involving more than 10,000 healthy volunteers. To date, every single one has failed. The HIV mortality rate has not plummeted because of vaccines but because of the development of effective drug cocktails. The coronavirus must be managed in the same way as HIV, with therapeutic drug cocktail protocols, not vaccines. We could still be four years away from having an effective therapeutic cocktail solution to the virus.

Only therapeutic solutions will succeed against this awful virus; we are still about four years away from developing the right drug combination

The virus has weaknesses; there are parts of the virus that do not mutate. Those should be targeted as was the case with HIV. Below are some of the important elements that need to be considered in the development of a coronavirus therapeutic solutions.

1. The coronavirus replicase is extremely complex and is believed to be comprised of up to 16 viral subunits and several cellular proteins.
2. Viral proteases are enzymes that catalyze the cleavage of specific peptide bonds in viral polyprotein precursors or in cellular proteins.
3. Viral assembly inhibitors customized to the coronavirus using similar technology as is used for HIV treatment could be used in a drug that blocks the viral enzymes reverse transcriptase and protease.

Urgent therapeutics are needed to halt oxygen deprivation

4. There is an urgent need for therapeutics that will stop the oxygen deprivation caused by the virus rather than trying to kill the virus. Preventing oxygen deprivation in infected patients will keep them from dying and avert long term organ damage because of lack of oxygenation. The immune reaction caused by the virus kickstarting various inflammatory onslaughts needs to be toned down.

Currently, researchers at Tel Aviv's Ichilov Medical School have successfully carried out development of a new medication that is delivered directly to the lungs through an inhaler. The first clinical trials of recombinant protein EXC-CD24, were a great success with 29 out of 30 walk aways after 3 to 5 days. The medication helps prevent complications that can arise from the immune system's overreaction as a result of it

dealing with COVID-19. We certainly hope they have continued success as they move in the second and third round of trials. The world is awaiting a serious solution to replace the already failed vaccines disaster.

<https://bgr.com/2021/02/06/coronavirus-cure-exo-cd24-trial-israel/>

Only through preventive therapeutics can we overcome fear of the virus

The world has become very afraid of the virus. Government leaders are panicking and compounding the problem when what is needed right now is reassurance. The focus of scientific researchers should be to develop therapeutic solutions that can disrupt the progress of the virus in the patient before the oxygen deprivation phenomenon begins. Such treatments could function as a preventative measure to the oxygen deprivation early in the coronavirus cycle after infection.

Hospitalization numbers may keep climbing. In the meantime, being able to mitigate the harmful effects of COVID-19 would take pressure off the hospitals. Currently about 3% of coronavirus patients end up on respirators. In those cases, an inflammatory cascade causes the lungs to harden to the point that they look like a hamburger and they lose their capacity to remove carbon dioxide from the blood and properly oxygenate the body. Therapeutics that can stop the oxygen deprivation are urgently needed. They can be given to the patient before serious lung deterioration sets in and help stop the decline or may work as a preventive measure. Since these kinds of therapeutic treatments do not go after the actual virus, their efficacy is not affected by viral mutations as a vaccine would be.

What curve, what numbers?

Governments should stop telling us the curve has peaked and numbers are declining. One curve that has not peaked is the coronavirus misinformation campaign. How can they continually tell us we have accurate numbers when not everyone is being tested every three days? The less testing that takes place, the lower the reported numbers will be

Alarming bombshell warning- Vaccines have already failed the new Variants

In my last [op-ed from November](#), I warned of the possibility of coronavirus “escape mutants” that could render vaccines ineffective. Today, three months after my original comments on the subject it is now confirmed that new variants are escaping the effects of the vaccines as I predicted they would. The most recent strains discovered in England, Africa, Brazil, and Japan are already rendering the current COVID-19 vaccines obsolete, with new variants evolving as we speak. Another concern is the speed of transmission of these new mutants. It is suspected that the latest English variant could be as much as 30% more infectious.

What does it mean if a vaccine is only 50% effective against a variant?

We are already getting reports that some of the vaccines could be as little as 50% effective against some of the new variants of the coronavirus. Simple math suggests

that those people that have received the vaccine are still vulnerable to half of the strains. As the virus continues to mutate it will eventually render the vaccine 100% useless.

<https://www.thesouthafrican.com/news/is-new-variant-south-africa-vaccine-resistant-covid-19-mutations/>

Have governments missed the mark? Why are they continuing to rush vaccines that are already outdated and ineffective?

Why are governments rushing to vaccinate against the old variant? What will happen to those millions of people who got the vaccine, many of which will be infected with the coronavirus by the end of this year? It is worrying to think that because of the potential for antibody dependent enhancement (ADE), the possibility exists that the vaccines could speed up the infection when a person contracts the virus. A vaccinated person could become seriously endangered if they get coronavirus.

Continued government stimulus relief packages and reduced tax revenues could trigger a great depression

The trillions of dollars spent on stimulus by the USA and Europe are well received measures by the markets based on the assumption the vaccines work as intended. But I predict that by the end of 2021 or before, the markets will begin their steepest decline ever recorded as vaccinated people begin to get infected by the virus they were supposed to be protected against. This will begin the biggest depression of all time.

Market upward fluctuations could be the calm before the coming recession due to a serious decline in economic activity. Recently I predicted that before the start of 2022, an economic collapse will begin that will be so big it will make the Great Depression of October 1929 seem mild. I believe such a depression could come sooner; by the last quarter of 2021.

My advice to people is to liquidate some share positions now and replace them with physical silver to protect themselves against a serious market collapse like we have never seen before. If you cannot buy silver due to the supply shortage, then keep liquid cash. Later, you will be able to buy shares back more than fifty percent cheaper than before the coming great depression. I suggest that cryptocurrency lovers hold on to their seats. Once the market begins to decline bitcoin will collapse very fast.

Compassion, moratoriums on loans, and government support will be needed over the next three years

I am a supporter of the free-market and entrepreneur, but over the next three years in 2022, 2023 and 2024 we need to focus more on compassion and have a plan to help those who are suffering and will suffer financial hardships in the wake of the pandemic. I believe by the end of 2021; the failure of the vaccines will be apparent to all and will become an accepted reality. Hundreds of thousands of companies could go bankrupt, especially the small businesses will be the ones most affected.

We cannot stand another year of business closure, imagine three years, we will have a majority out of work, we need to at least to be ready to provide housing and food.

In an [article I wrote in February 2020](#), I predicted zombie companies would fold in Europe. I believe the same will happen in the United States. Men and women will be laid off by the millions. When that happens how will they feed their families?

Task force for compassionate preparedness is well overdue

We need to have a plan of action in place for 2022 and 2023 that will provide supportive measures for the millions of families that will be displaced after losing their jobs because of failed vaccines.

The average family does not have much savings and those that do, certainly do not have enough to last more than just a couple of months. Government leaders need to put task forces in place to prepare for this contingency and have programs ready to provide basic needs for those enduring such hardships.

The task force needs to have a three-year spending plan starting in 2022. We cannot put our heads in the sand banking on vaccines that have already started to become a failure. Across the board moratoriums to freeze the repayment of loans, mortgages, and rents should be considered as well as a utility payment freeze. Food distribution voucher plans need to be ready to go. I urge all western leaders to start planning now for what I believe will be an inevitable outcome by the end of 2021. We need to have a stockpile of non-perishable food items now to be ready to feed people. Homeowners that have even a small piece of land should consider planting some crops to help become self-sufficient. Installing a greenhouse or a hydroponic system would be very beneficial.

<https://apple.news/ATpWdORJ5Q0yQ1SEILD55P>

The new U.S. administration has some excellent points in its coronavirus national strategy

The Biden Administration's newly released [national strategy](#) for handling COVID-19 is an extremely well written paper that puts forth an excellent strategy on many points including prioritizing the research for new therapeutics. For the first time, the systematic testing of all antivirals in combination is being permitted to take place at the outset. This alone will streamline the development time of new therapeutics, get products to and through toxicity testing and clinical trials much quicker, and could reduce the approval process by three years saving millions of dollars. Researchers will now be able to conduct testing of multiple inhibitors on human cells at one time, in lieu of having to test them one by one. They will also be able to conduct drug cocktail testing on cancerous tumours and other diseases much sooner than they were previously. These provisions could make it possible for the faster development of a therapeutic cocktail to moderate the dangerous cascading lung inflammation caused by COVID-19.

That aside, I am continuing my avid warning to this administration about the potential dangers of the current vaccines. I hope they consider rolling back their aggressive

campaign to reach 100 million vaccinations in 100 days. We are constantly receiving new information which suggests the declining efficacy of the vaccine. The new vaccines began with promises of 95% effectiveness, but those numbers are rapidly dropping as new data comes in. Could the current admissions that the vaccines may not be effective on new strains of the virus be a way of creating a soft landing ahead of the future revelations of widespread vaccine failure that will eventually become known? I have been consistent in my calls to pause the ongoing vaccine program until further data can be confirmed that can ensure the safety and efficacy of the current vaccines.

What's next; a mutation more lethal than MERS?

In some [previous op-eds](#) I warned about the possibility of the coronavirus mutating into a MERS type virus that could be even more lethal than MERS. Let's suppose that a country with a large camel population like Kazakhstan, has an abundance of camels carrying the MERS virus. The MERS virus could easily jump from camels to humans. If a human gets infected with the MERS virus while having an active COVID infection, the recombination of the two viruses could potentially create a new mutant far more lethal than MERS that has killed more than 25% of those infected. A new COVID-20/21/22.

As I have [stated in the past](#), I am extremely impressed with Prof. Christian Drosten, Director of the Institute of Virology on Campus Charité Mitte, Berlin, Germany. I hope Dr. Drosten is already looking ahead to the possibility of a combined mutation of MERS and COVID-20/21/22.

Are we about to experience a new Black Death-Bubonic plague, only far worse?

The Bubonic plague caused the Black Death that struck Europe and Asia in the mid-1330s. It originated from a bacterium called Yersinia pestis which is different from the coronavirus which is caused by a virus.

Could the coronavirus cause a modern-day Black Death?

What is most concerning to me is the fact that the Bubonic plague rarely spread from person to person. Transmission takes place through contact with fleas that are infected with the bacteria. The plague has a staggeringly high rate of death; 10% if treated, 30% to 90% if untreated. The coronavirus is dangerous because it does not just spread from human to human, and infected people can be completely asymptomatic showing no signs or symptoms of the virus.

A recent Lancet report is misleading and potentially dangerous

With all due respect to the scientific publications that report on the efficacy of coronavirus vaccines, a recently published Lancet report on the topic of vaccine efficacy could be misleading. The report said the Russian COVID-19 vaccine Sputnik V achieved a 92% effective rate against the virus. What exactly does that mean? I have

already pointed out in a past op-ed that in about 80% of infected people the ability of the B memory cells to reproduce neutralizing antibodies seems to be somehow disabled by the virus up to eight months after infection. Therefore, it is meaningless for a report to state that a vaccine is 92% effective at this stage in the game. It would be better to wait at least 8 months before making an evaluation of this magnitude for a report such as this.

<https://www.cidrap.umn.edu/news-perspective/2020/12/two-studies-find-covid-19-antibodies-last-8-months>

<https://www.wsj.com/articles/russian-covid-19-vaccine-was-highly-effective-in-trial-study-finds-boosting-moscows-rollout-ambitions-11612269047>

Silver will replace the gold standard; gold standards are fool's gold

In my most recent article updated last December, I suggested that silver should become the future currency valuation standard to replace the former gold standard. My suggestion was mocked by many staunch supporters of gold. Gold has become a useless commodity that has been artificially supported by the Federal Reserve Bank that represents some self-interested groups trying to make billions themselves. To them the average person is nothing more than an expendable commodity. To accurately value currency the commodity must have an industrial value like silver. As I said before "Gold is useless as an industrial commodity and is mainly used for fine jewelry. It is often used by some to indulge their vanity and convey an appearance of social status."

<https://ceocfointerviews.com/emilmalakoped1220.html>

One year since my first coronavirus op-ed in February 2020

Shortly after writing my first article on the coronavirus, some accused me of being overly dramatic. Even some of my friends wrote to me and requested that I refrain from making any future predictions because I lacked the scientific qualifications. It is true that I am not a scientist, nor have I ever tried to pass myself off as one. However, my personal credentials aside, my articles are based completely on scientific information gathered from my own research. I have spent many hours studying scientific papers and researching other coronaviruses as well as past pandemics. I have also spent a lot of time discussing the science behind the current virus with several highly qualified experts in the field. As a result, many of the predictions I made eventually came true. Since it is the one-year anniversary of my first article I thought I would list some of the early predictions I made in that first op-ed that have since come to fruition.

Predictions from my first article:

- On the day, my first article was published, February 20, 2020, little was known about the virus as it was mostly contained in China and surrounding areas. The United States only had 16 confirmed cases at the time, but I declared that the world was already in a global pandemic. The WHO did not declare a global pandemic for another three weeks on March 11th.
- Virus mutations would render an eventual vaccine ineffective. Today we are seeing escape mutants that are evading the current vaccines.

- I predicted the stock market could take big hits like 2008. In the month after my article was published the market fell 33%.
- I predicted nationwide quarantines and encouraged people to stock up on essential supplies. In the coming weeks we saw worldwide shutdowns that turned major cities into ghost towns.
- At the beginning of the pandemic, we were told this would be a short-term problem lasting just a few weeks. A year ago, I said we would be dealing with this for at least 12 months.
- As previously mentioned, I predicted zombie companies would trigger a big banking problem in Europe. Last month the Wall Street Journal ran an article stating that European zombie companies could stunt bank recovery.
<https://www.wsj.com/articles/zombies-could-stunt-the-bank-recovery-11610447847>

February 13, 2021 Update

The Coronavirus Has Started a Third World War

America is facing a serious national security threat

Throughout history, economic depression has been the main trigger that has started wars. By the end of 2021, the mishandling of the coronavirus endemic by western governments will prove to be economically catastrophic. A war between countries does not necessarily need to be initiated by a physical conflict; a virus could be the initiator. The previous U.S. administration's Operation Warp Speed has failed us by putting the bulk of the resources into a vaccine and neglecting the development of therapeutics and effective rapid testing support.

As I have previously pointed since I began writing op-eds on the pandemic in February 2020, vaccines have not worked for MERS, SARS, HIV, Malaria, etc. Why do we think a vaccine will work now for COVID-19? Today, the U.K.'s new Kent virus strain is 35% more transmissible and has already spread to 50 countries. What will be in store for us tomorrow? The misinformation spin machine led by the Silicon Valley, social networking platforms and the mainstream media is still pushing the vaccine narrative in spite of the fact that escape mutants have rendered those vaccine no longer as effective against the new variants. The escape mutants could be much more lethal to people infected by having been vaccinated.

Direct fallout due to government impotence

The initial impact of an economic depression will be felt first in the United States, Europe, Canada and Australia, by late 2021 to early 2022, then the rest of the world will follow. This could lead to the breakup of the European Union. Central and Eastern European countries will start to leave once Germany is no longer able to support them financially. Anti-globalization will become a necessity for survival. The more prosperous

and rich U.S. states could feel the impact of recession. Currencies backed by useful industrial metals like silver rather than gold will become more valuable and will dominate the world currency markets. The once mighty dollar could be in trouble.

I do not discount the possibility of a future nuclear war being triggered by economic collapse. Countries with nuclear capabilities and failed economies could do desperate things. Every empire eventually falls as will be the case with China. When they consider themselves to be strong and in control, they can be the most vulnerable to internal revolt that can bring them down.

How to avert total economic collapse

America cannot afford to allow other countries to beat them at developing therapeutic solutions. They not only need to develop therapeutic solutions, but they need to manufacture them domestically and keep it secretive. A solution to the fear of coronavirus death is a weapon that must be protected before it is distributed to the rest of the world. Manufacturing of these drugs could be the springboard for economic revival.

America needs to take the lead once again in terms of the economy. They can do that by:

- developing an effective rapid virus test in order to test everyone every three days as I have often written about
- utilize the military to effectively and efficiently carry out testing
- focus on therapeutic solutions that will stop people from dying from the virus
- Admit the failure of the vaccines and halt vaccine distribution
